Lab 7: RIPv2 Router Configuration

Topology Diagram

Addressing Table

Device	Interface	IP Address	Subnet Mask	Default Gateway
R1	Fa0/0	172.30.1.1	255.255.255.0	N/A
	Fa0/1	172.30.2.1	255.255.255.0	N/A
	S0/0/0	209.165.200.230	255.255.255.252	N/A
R2	Fa0/0	10.1.0.1	255.255.0.0	N/A
	S0/0/0	209.165.200.229	255.255.255.252	N/A
	S0/0/1	209.165.200.233	255.255.255.252	N/A
R3	Fa0/0	172.30.100.1	255.255.255.0	N/A
	S0/0/1	209.165.200.234	255.255.255.252	N/A
	Lo0	172.30.110.1	255.255.255.0	N/A
	Lo1	172.30.200.17	255.255.255.240	N/A
	Lo2	172.30.200.33	255.255.255.240	N/A
PC1	NIC	172.30.2.10	255.255.255.0	172.30.2.1
PC2	NIC	172.30.1.10	255.255.255.0	172.30.1.1
PC3	NIC	10.1.0.10	255.255.0.0	10.1.0.1
PC4	NIC	172.30.100.10	255.255.255.0	172.30.100.1

Learning Objectives

Upon completion of this lab, you will be able to:

- Cable a network according to the Topology Diagram.
- Load provided scripts onto the routers.
- Examine the current status of the network.
- Configure RIPv2 on all routers.
- Examine the automatic summarization of routes.
- Examine routing updates with `debug ip rip`.
- Disable automatic summarization.
- Examine the routing tables.
- Verify network connectivity.
- Document the RIPv2 configuration.

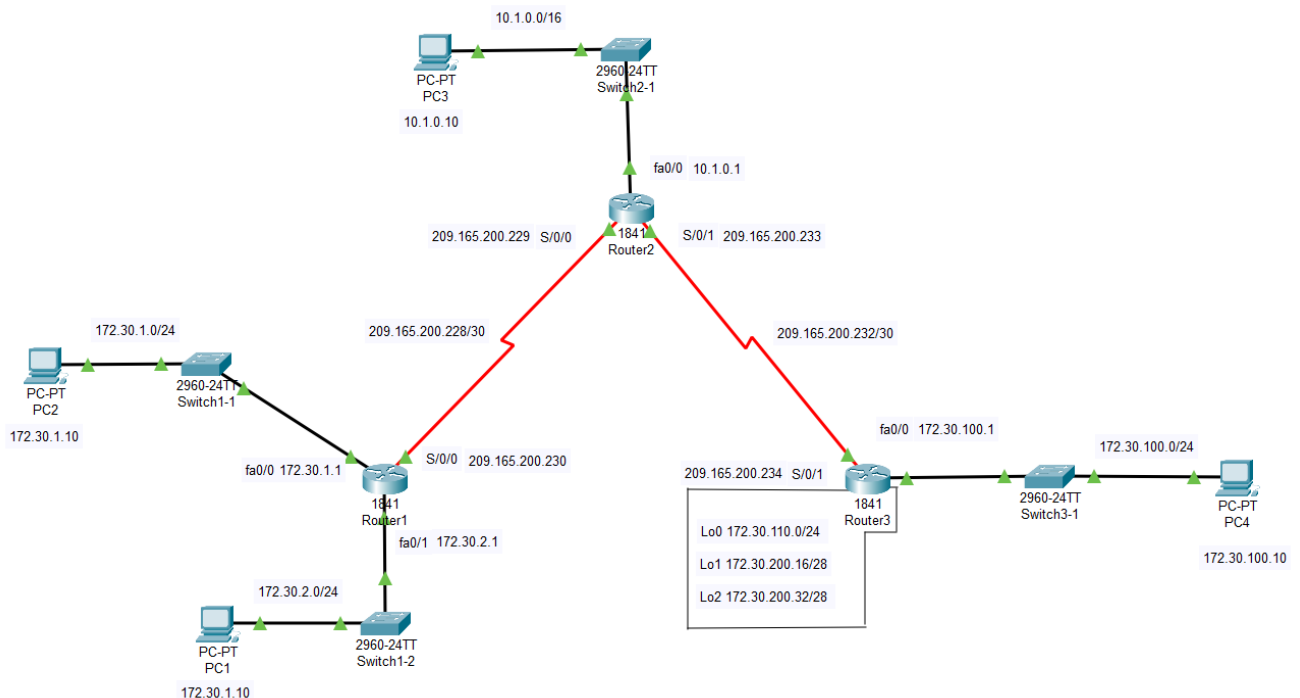

Scenario

The network shown in the Topology Diagram contains a discontinuous network, 172.30.0.0. This network has been subnetted using VLSM. The 172.30.0.0 subnets are physically and logically divided by at least one other classful or major network, in this case the two serial networks 209.165.200.228/30 and 209.165.200.232/30. This can be an issue when the routing protocol used does not include enough information to distinguish the individual subnets. RIPv2 is a classless routing protocol that can be used to provide subnet mask information in the routing updates. This will allow VLSM subnet information to be propagated throughout the network.

Task 1: Cable, Erase, and Reload the Routers.

Step 1: Cable a network.

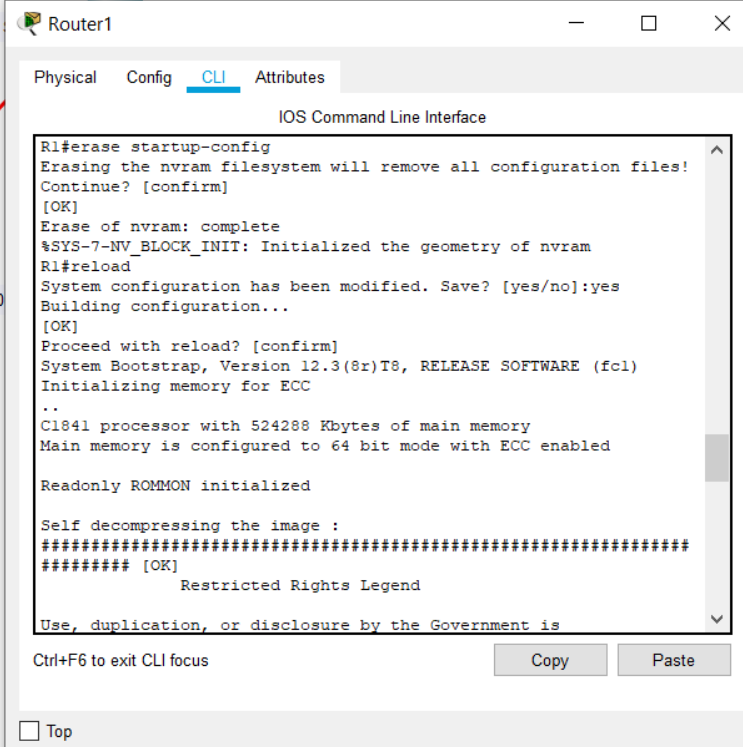

Cable a network that is similar to the one in the Topology Diagram.

Step 2: Clear the configuration on each router.

Clear the configuration on each of routers using the **erase startup-config** command and then **reload** the routers. Answer **no** if asked to save changes.

Task 3: Examine the Current Status of the Network.

Step 1: Verify that both serial links are up.

The two serial links can quickly be verified using the `show ip interface brief` command on R2.

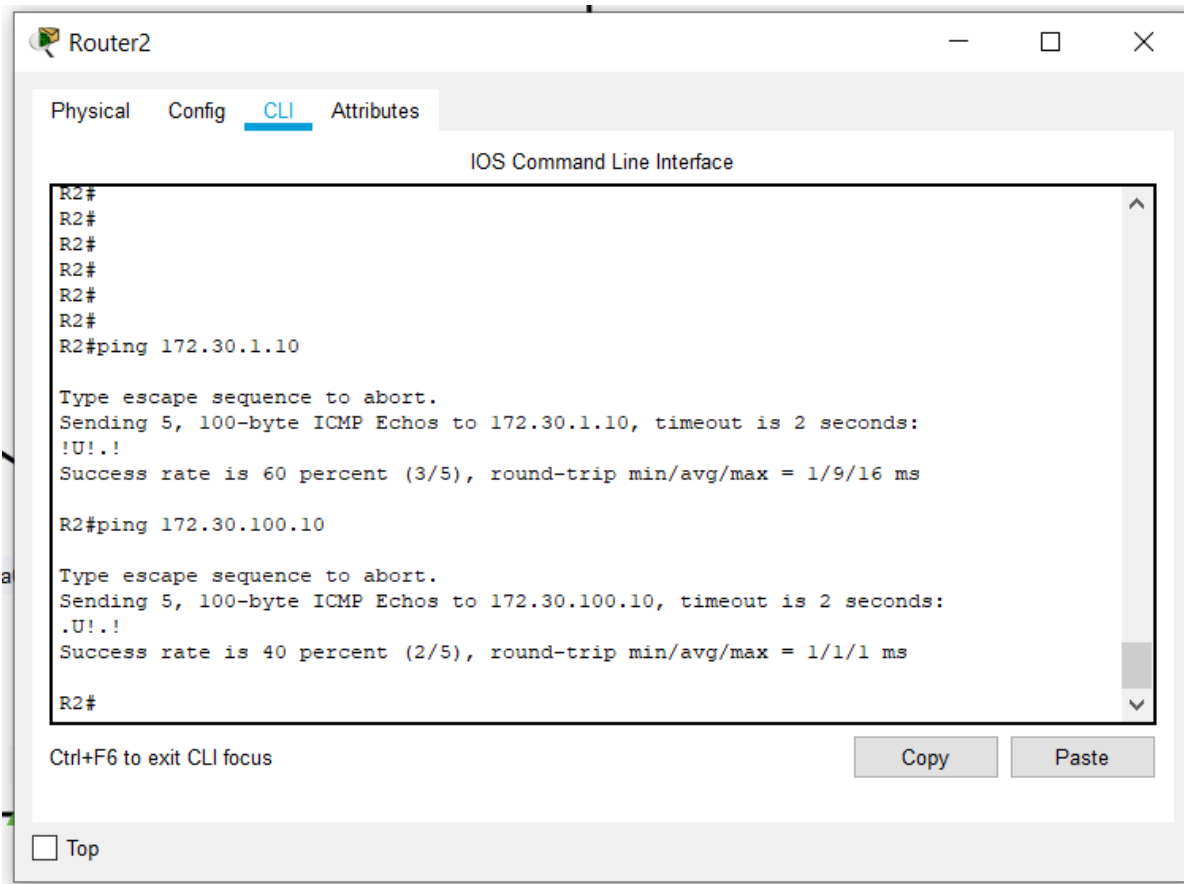

```
R2#show ip interface brief
```

Step 2: Check the connectivity from R2 to the hosts on the R1 and R3 LANs.

Note: For the 1841 router, you will need to disable IP CEF to obtain the correct output from the `ping` command. Although a discussion of IP CEF is beyond the scope of this course, you may disable IP CEF by using the following command in global configuration mode:

```
R2(config)#no ip cef
```

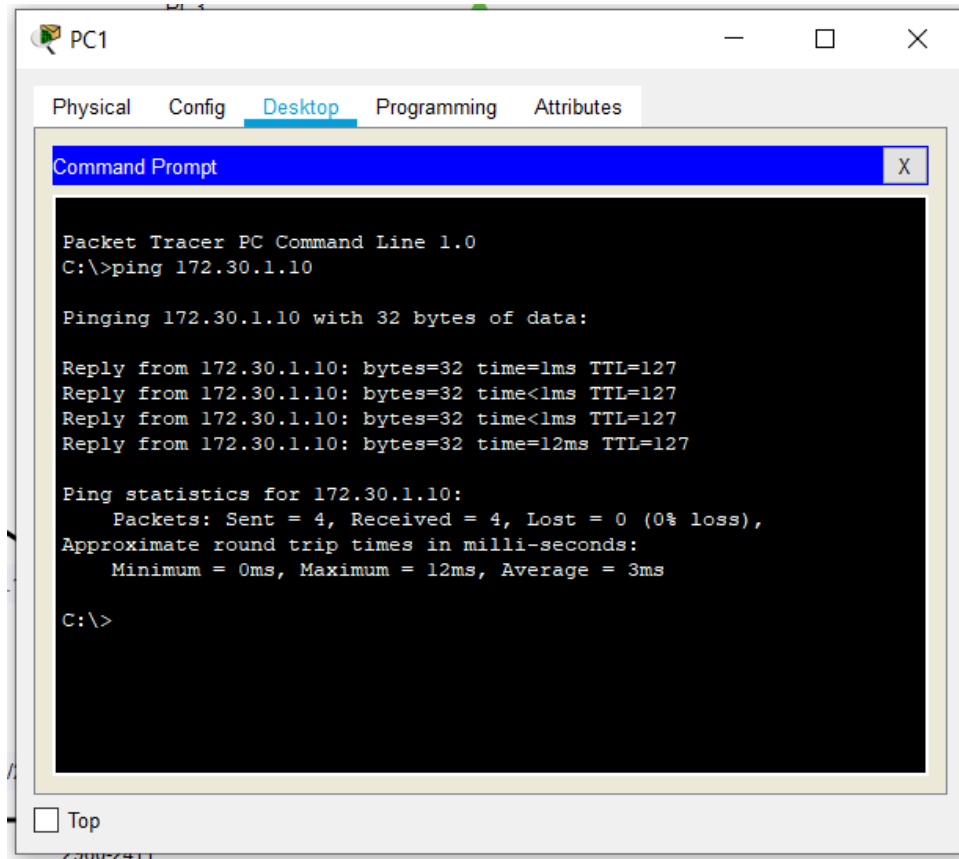

From the R2 router, how many ICMP messages are successful when pinging PC1?

3 out of 5

From the R2 router, how many ICMP messages are successful when pinging PC4?

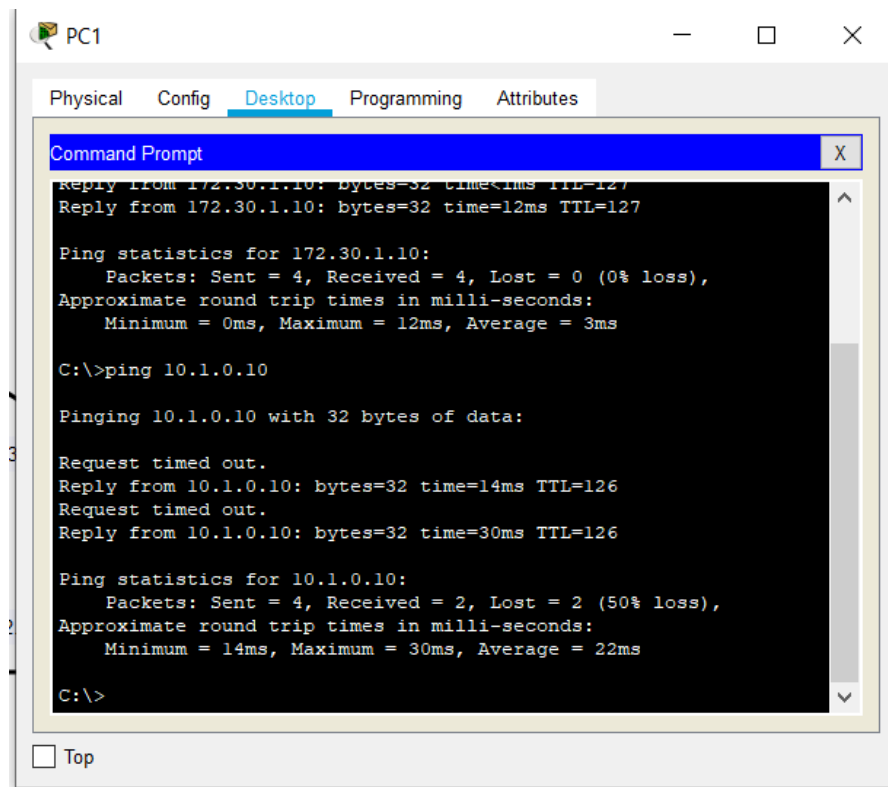

2 out of 5

Step 3: Check the connectivity between the PCs.

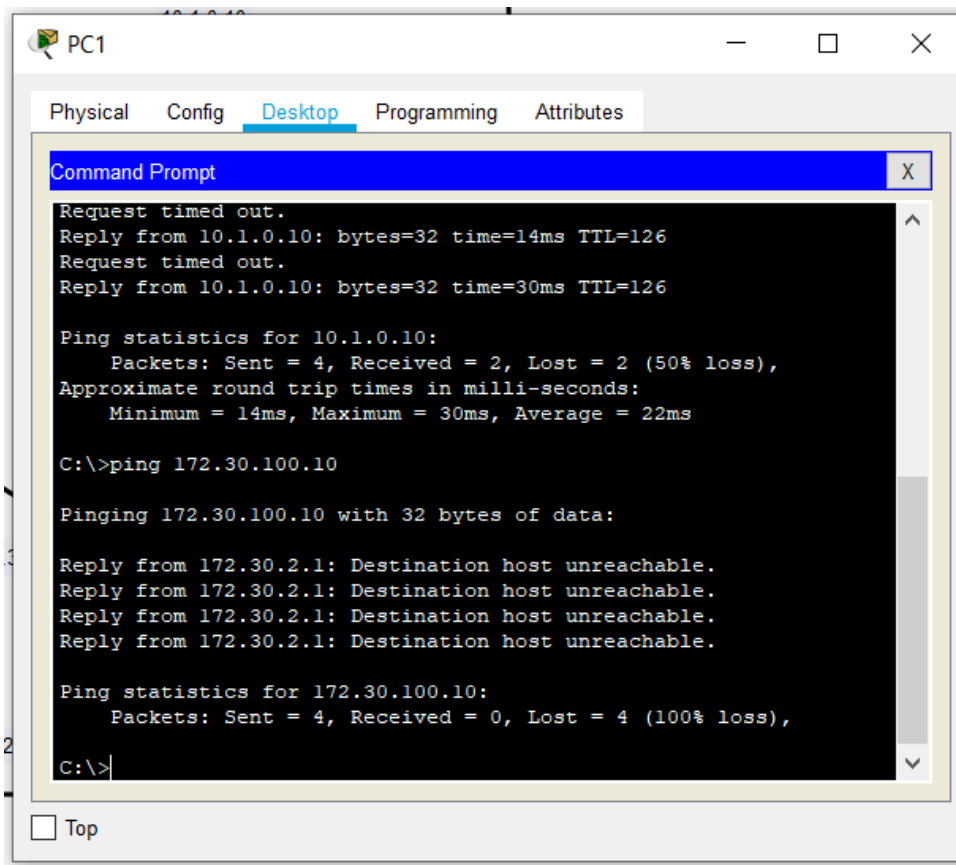

From the PC1, is it possible to ping PC2? ____ **YES** ____

What is the success rate? ____ **100%** ____

From the PC1, is it possible to ping PC3? YES

What is the success rate? 50%

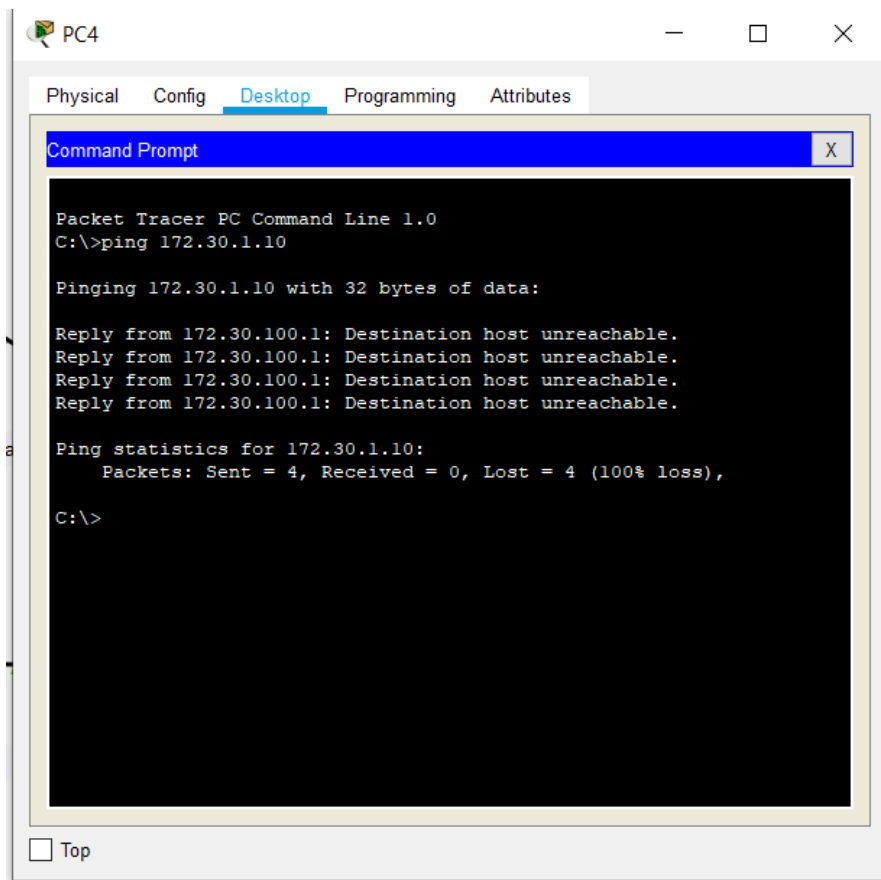

The screenshot shows a window titled "PC1" with tabs for "Physical", "Config", "Desktop", "Programming", and "Attributes". The "Desktop" tab is active, displaying a "Command Prompt" window. The Command Prompt shows the results of a ping command to 10.1.0.10 and 172.30.100.10. The first ping to 10.1.0.10 shows a 50% success rate (2 out of 4 packets received). The second ping to 172.30.100.10 shows a 0% success rate (0 out of 4 packets received).

Ping statistics for 10.1.0.10:
    Packets: Sent = 4, Received = 2, Lost = 2 (50% loss),
    Approximate round trip times in milli-seconds:
        Minimum = 2ms, Maximum = 10ms, Average = 6ms

C:\>
```

At the bottom of the Command Prompt window, there is a "Top" button.

From the PC4, is it possible to ping PC3? YES

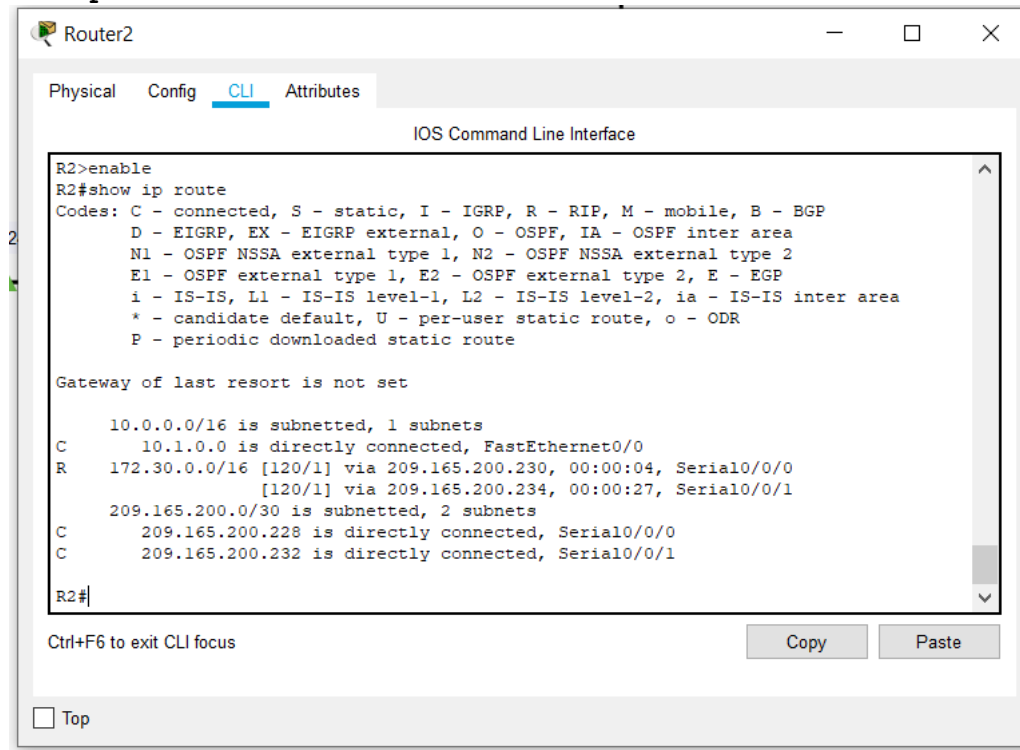

What is the success rate? 50%

Step 4: View the routing table on R2.

Both the R1 and R3 are advertising routes to the 172.30.0.0/16 network; therefore, there are two entries for this network in the R2 routing table. The R2 routing table only shows the major classful network address of 172.30.0.0—it does not show any of the subnets for this network that are used on the LANs

attached to R1 and R3. Because the routing metric is the same for both entries, the router alternates the routes that are used when forwarding packets that are destined for the 172.30.0.0/16 network.

R2#**show ip route**

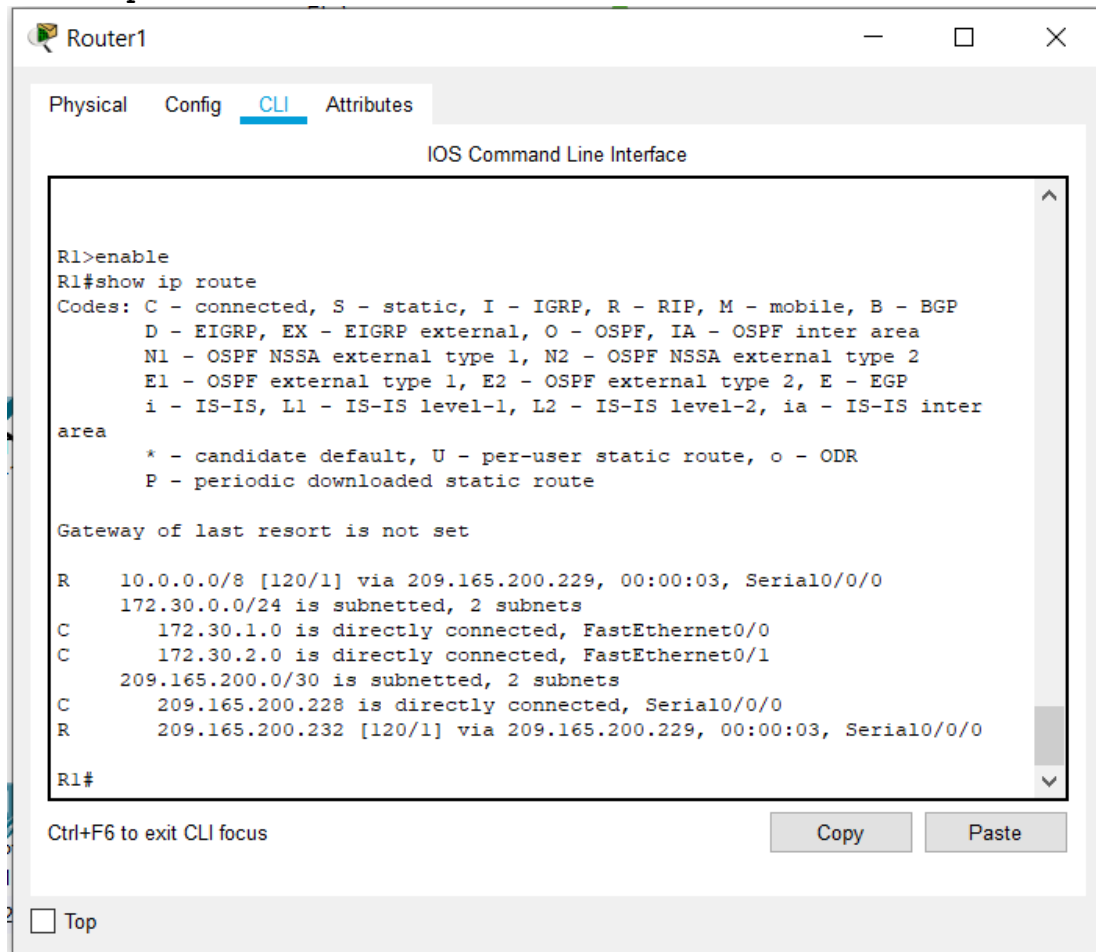

Step 5: Examine the routing table on the R1 router.

Both R1 and R3 are configured with interfaces on a discontinuous network, 172.30.0.0. The 172.30.0.0 subnets are physically and logically divided by at least one other classful or major network—in this case, the two serial networks 209.165.200.228/30 and 209.165.200.232/30. Classful routing protocols like

RIPv1 summarize networks at major network boundaries. Both R1 and R3 will be summarizing 172.30.0.0/24 subnets to 172.30.0.0/16. Because the route to 172.30.0.0/16 is directly connected, and because R1 does not have any specific routes for the 172.30.0.0 subnets on R3, packets destined for the R3 LANs will not be forwarded properly.

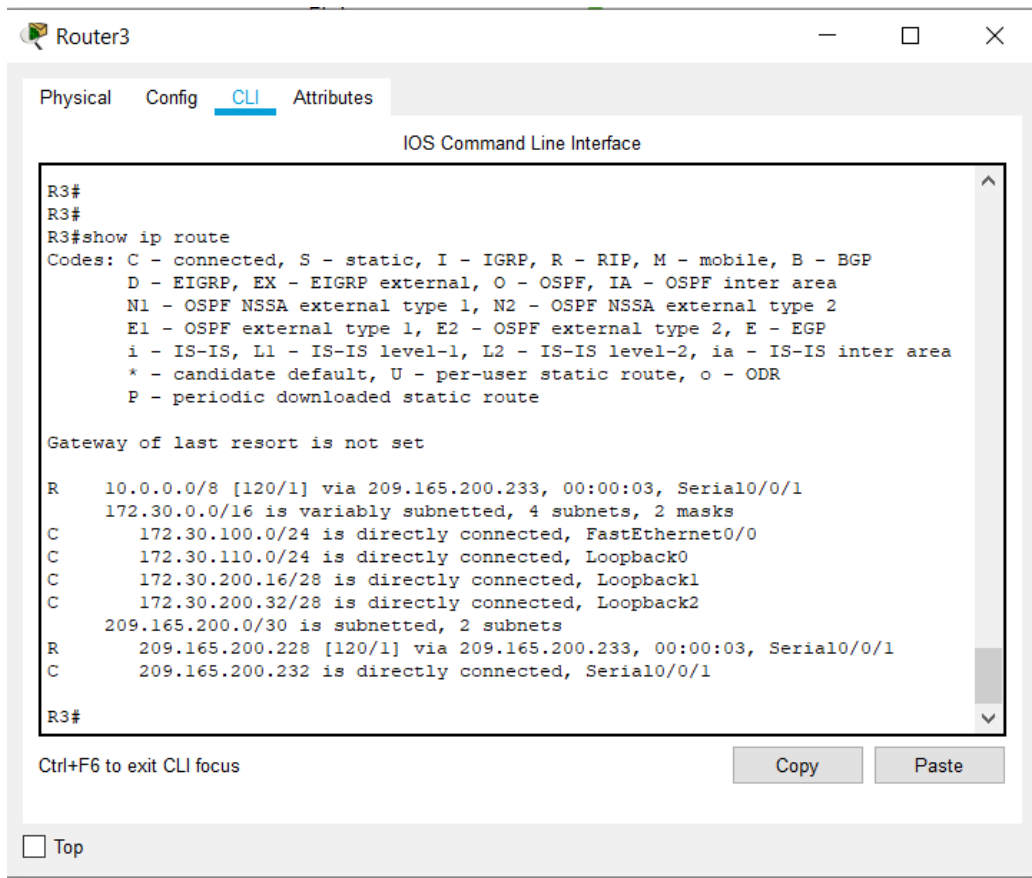

R1#show ip route

Step 6: Examine the routing table on the R3 router.

R3 only shows its own subnets for 172.30.0.0 network: 172.30.100/24, 172.30.110/24, 172.30.200.16/28, and 172.30.200.32/28. R3 does not have any routes for the 172.30.0.0 subnets on R1.

R3#**show ip route**

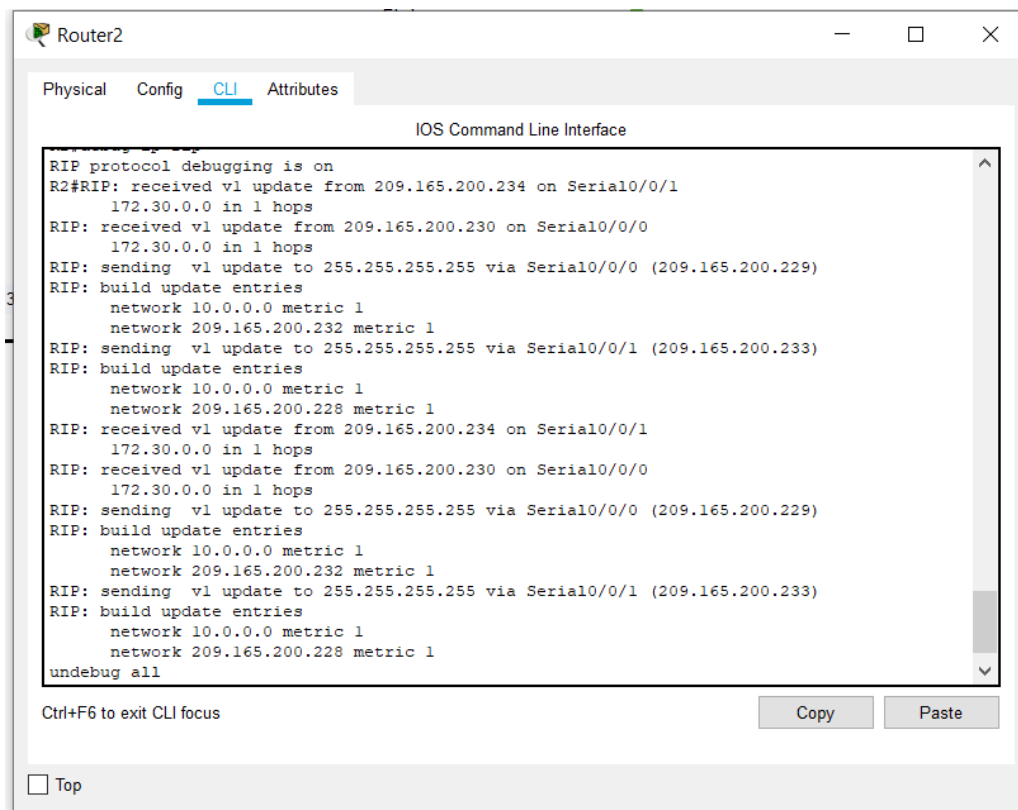

Step 7: Examine the RIPv1 packets that are being received by R2.

Use the **debug ip rip** command to display RIP routing updates.

R2 is receiving the route 172.30.0.0, with 1 hop, from both R1 and R3. Because these are equal cost metrics, both routes are added to the R2 routing table. Because RIPv1 is a classful routing protocol, no subnet mask information is sent in the update.

R2#**debug ip rip**

R2 is sending only the routes for the 10.0.0.0 LAN and the two serial connections to R1 and R3. R1 and R3 are not receiving any information about the 172.30.0.0 subnet routes.

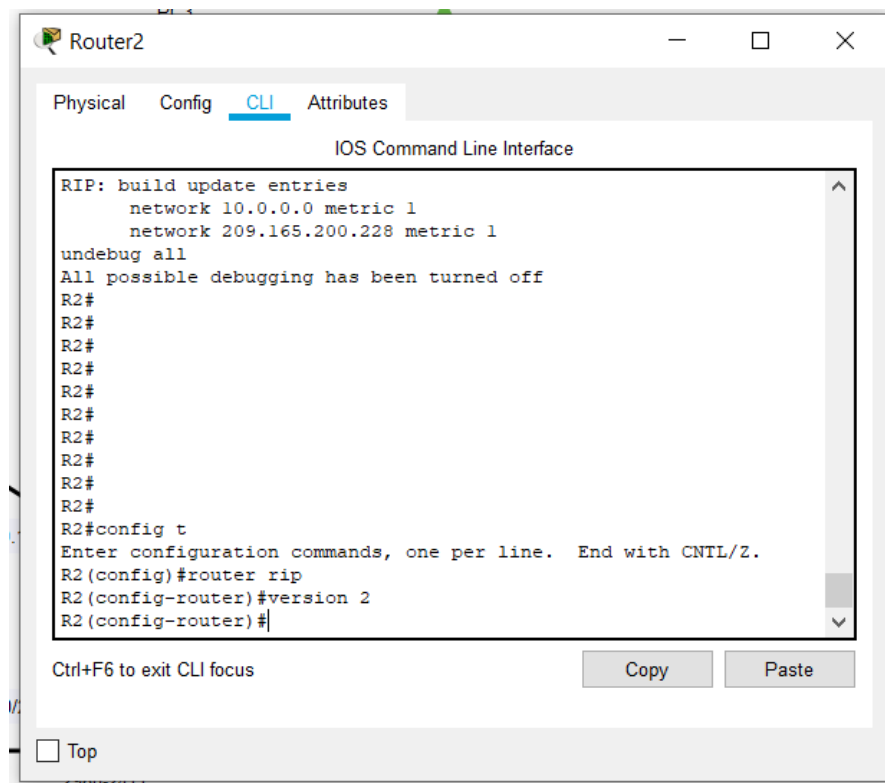

When you are finished, turn off the debugging.

R2#**undebug all**

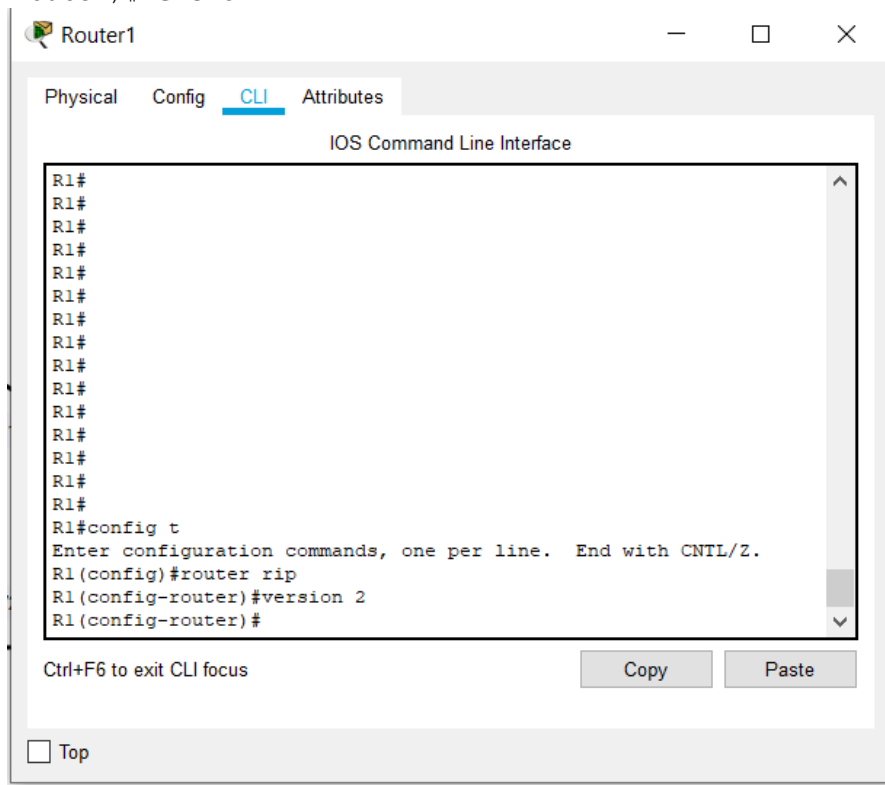

Task 4: Configure RIP Version 2.

Step 1: Use the `version 2` command to enable RIP version 2 on each of the routers.

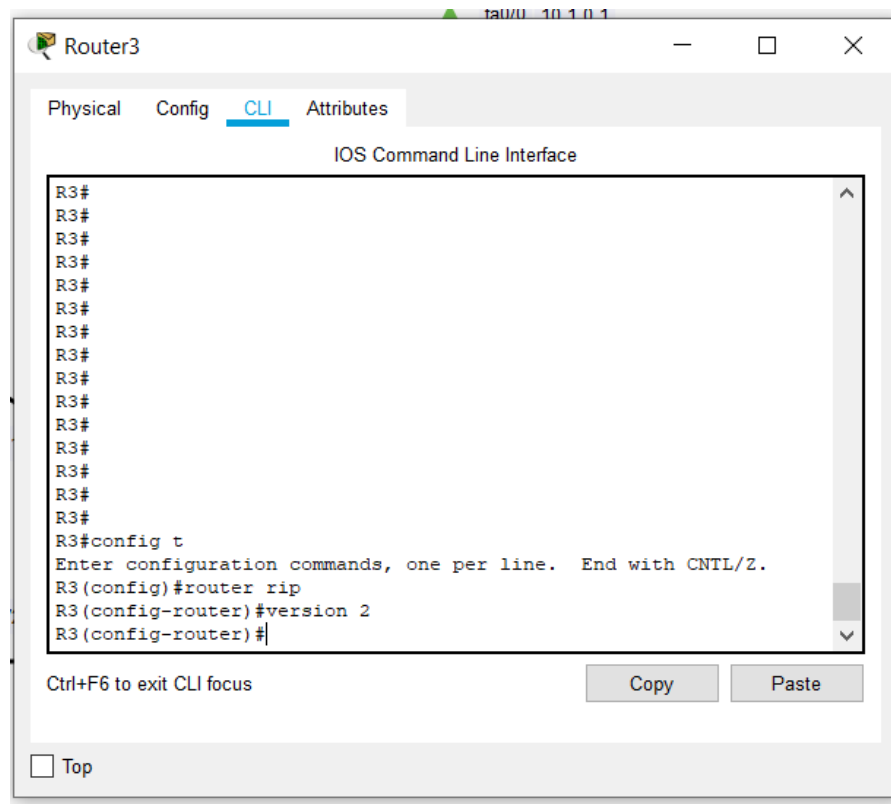

```
R2(config)#router rip
R2(config-router)#version 2
```

R1 (config) #**router rip**
R1 (config-router) #**version 2**

R3 (config) #**router rip**
R3 (config-router) #**version 2**

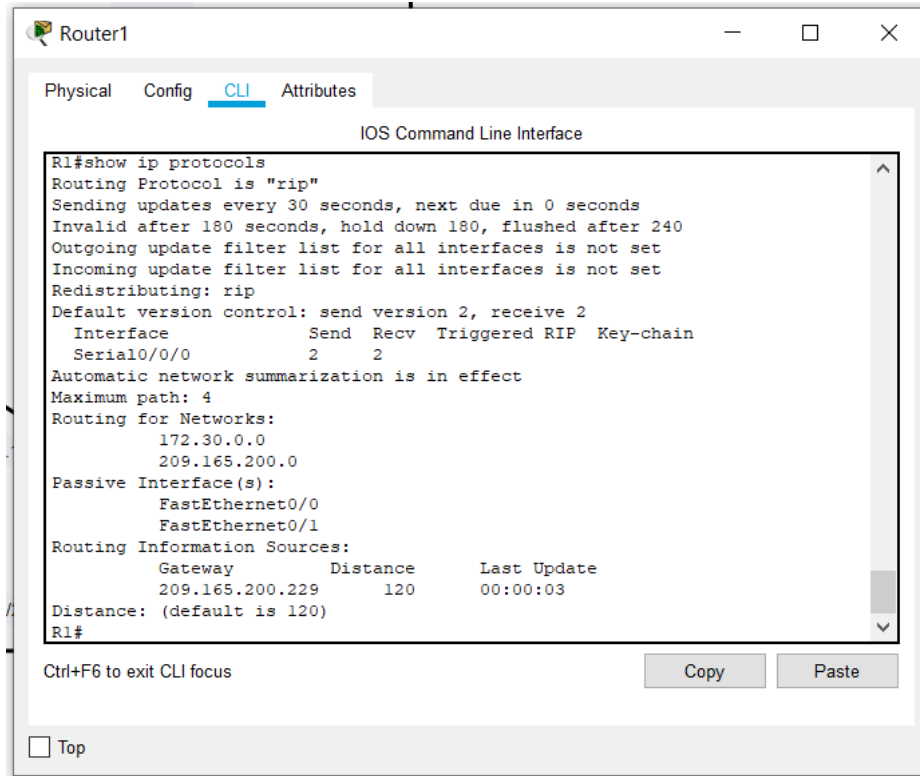

RIPv2 messages include the subnet mask in a field in the routing updates. This allows subnets and their masks to be included in the routing updates. However, by default RIPv2 summarizes networks at major network boundaries, just like RIPv1, except that the subnet mask is included in the update.

Step 2: Verify that RIPv2 is running on the routers.

The `debug ip rip`, `show ip protocols`, and `show run` commands can all be used to confirm that RIPv2 is running. The output of the `show ip protocols` command for R1 is shown below.

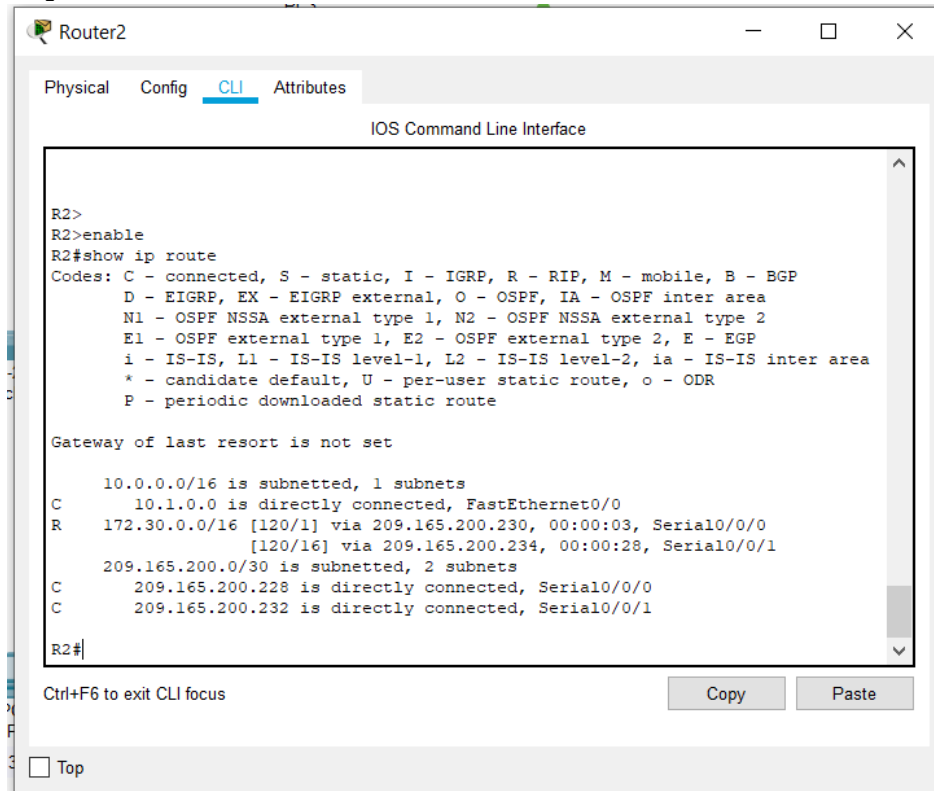

R1# show ip protocols

Task 5: Examine the Automatic Summarization of Routes.

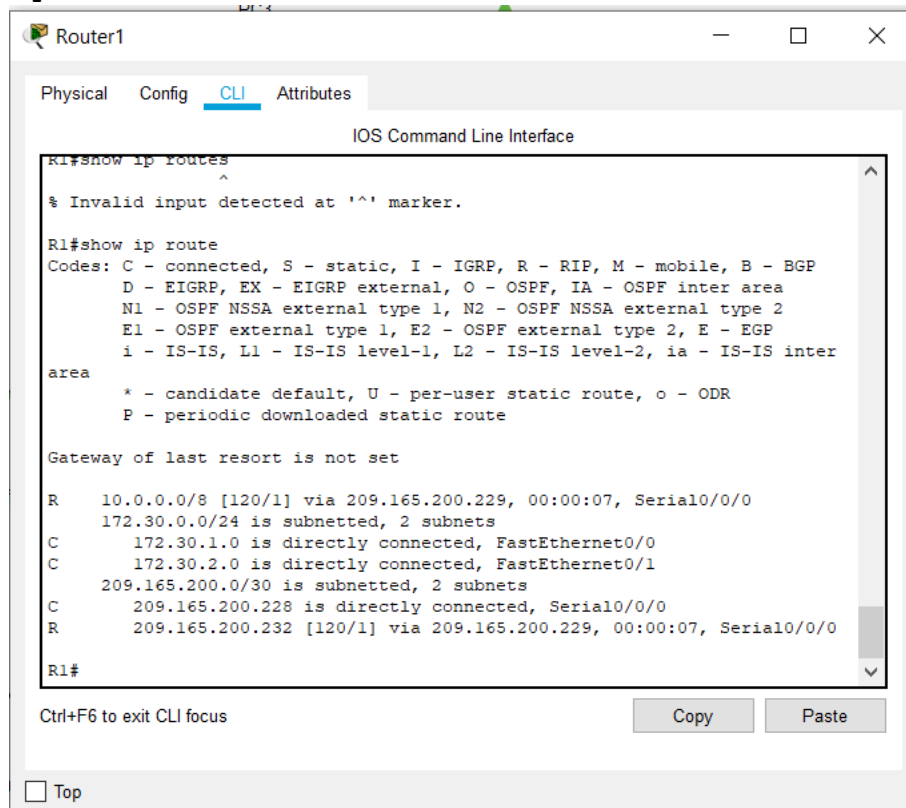

The LANs connected to R1 and R3 are still composed of discontinuous networks. R2 still shows two equal cost paths to the 172.30.0.0/16 network in the routing table. R2 still shows only the major classful network address of 172.30.0.0 and does not show any of the subnets for this network.

R2#show ip route

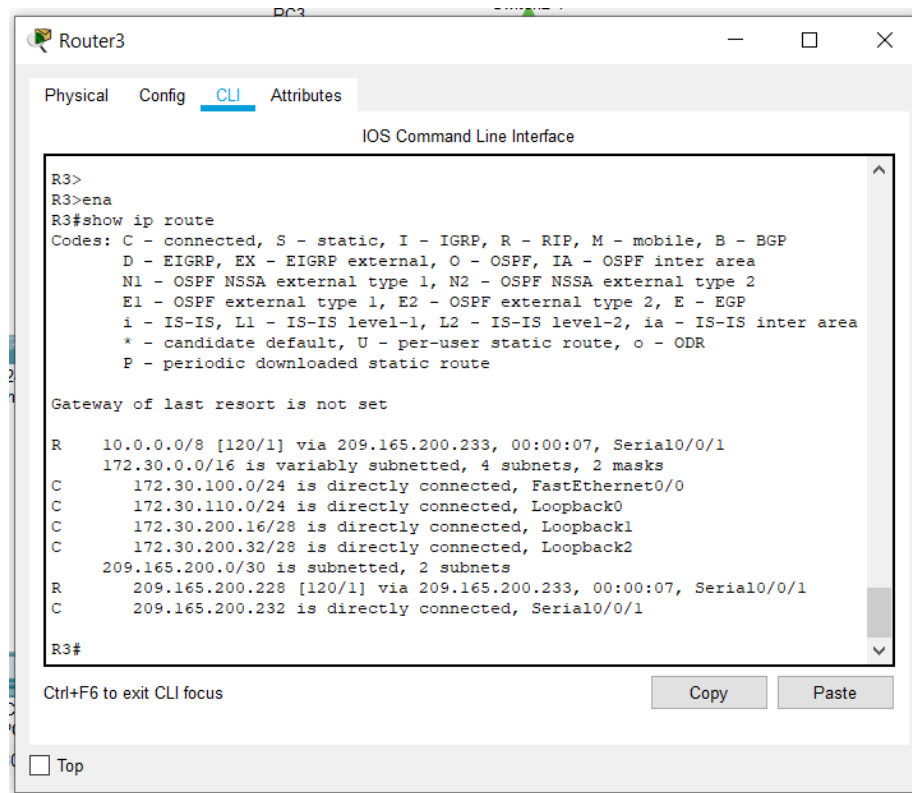

R1 still shows only its own subnets for the 172.30.0.0 network. R1 still does not have any routes for the 172.30.0.0 subnets on R3.

R1#show ip route

R3 still only shows its own subnets for the 172.30.0.0 network. R3 still does not have any routes for the 172.30.0.0 subnets on R1.

R3#**show ip route**

Use the output of the `debug ip rip` command to answer the following questions:

RIP: sending v2 update to 224.0.0.9 via Loopback0 (172.30.110.1)

RIP: build update entries

10.0.0.0/8 via 0.0.0.0, metric 2, tag 0

172.30.100.0/24 via 0.0.0.0, metric 1, tag 0

172.30.200.16/28 via 0.0.0.0, metric 1, tag 0

172.30.200.32/28 via 0.0.0.0, metric 1, tag 0

209.165.200.0/24 via 0.0.0.0, metric 1, tag 0

What entries are included in the RIP updates sent out from R3?

10.0.0.0/8

172.30.100.0/24

172.30.110.0/24

172.30.200.16/28

209.165.200.0/24

On R2, what routes are in the RIP updates that are received from R3?

RIP: received v2 update from 209.165.200.234 on Serial0/0/1

172.30.0.0/16 via 0.0.0.0 in 1 hops

RIP: received v2 update from 209.165.200.230 on Serial0/0/0

172.30.0.0/16 via 0.0.0.0 in 1 hops

RIP: sending v2 update to 224.0.0.9 via Serial0/0/0 (209.165.200.229)

RIP: build update entries

10.0.0.0/8 via 0.0.0.0, metric 1, tag 0

209.165.200.232/30 via 0.0.0.0, metric 1, tag 0

RIP: sending v2 update to 224.0.0.9 via Serial0/0/1 (209.165.200.233)

RIP: build update entries

10.0.0.0/8 via 0.0.0.0, metric 1, tag 0

209.165.200.228/30 via 0.0.0.0, metric 1, tag 0

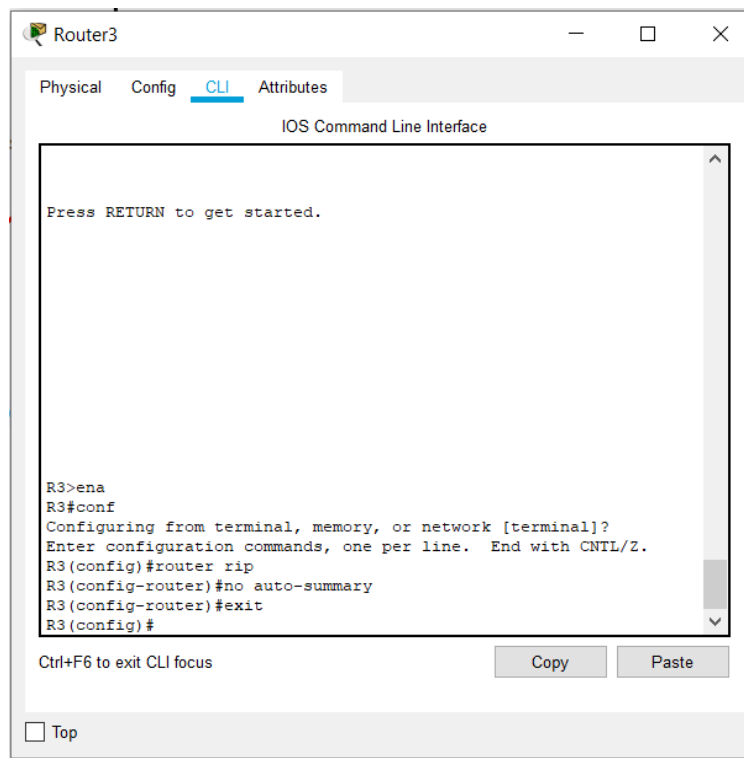

172.30.0.0/16

R3 is not sending any of the 172.30.0.0 subnets—only the summarized route of 172.30.0.0/16, including the subnet mask. This is why R2 and R1 are not seeing the 172.30.0.0 subnets on R3.

Task 6: Disable Automatic Summarization.

The `no auto-summary` command is used to turn off automatic summarization in RIPv2. Disable auto summarization on all routers. The routers will no longer summarize routes at major network boundaries.

```
R2(config)#router rip
R2(config-router)#no auto-summary
```

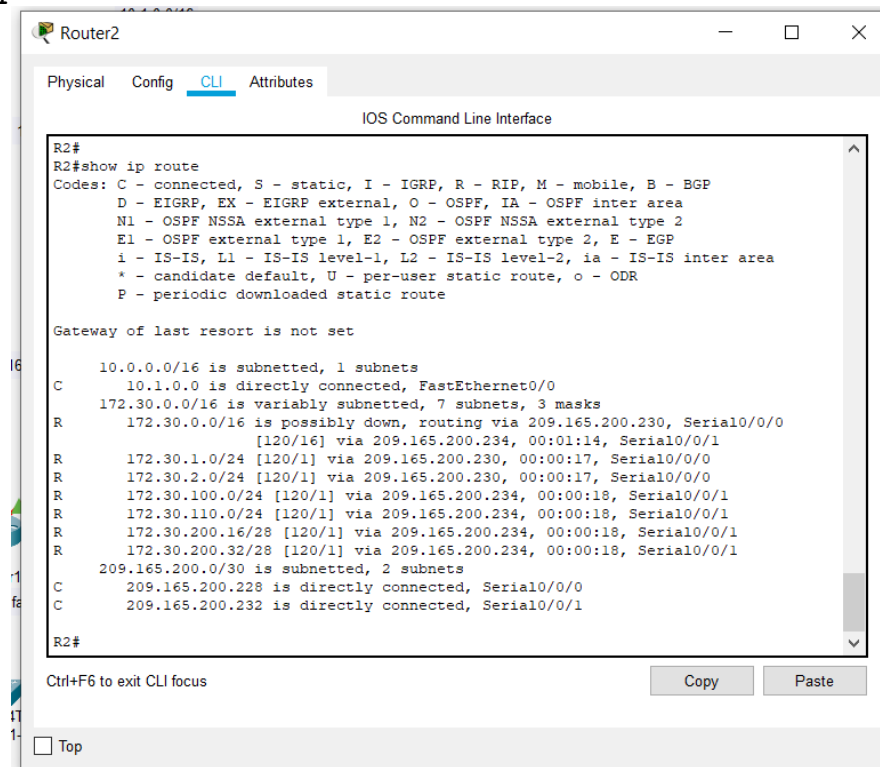

The `show ip route` and `ping` commands can be used to verify that automatic summarization is off.

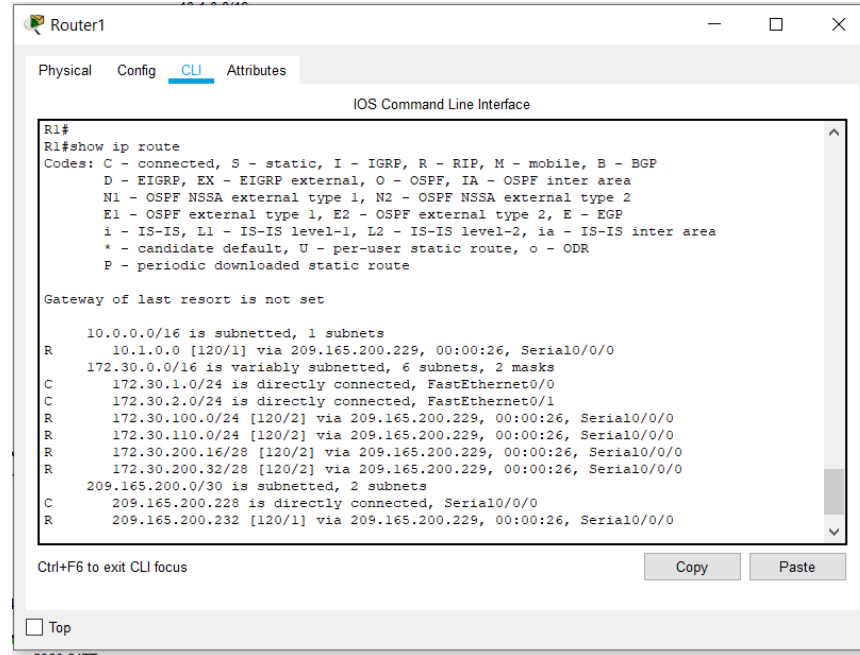

Task 7: Examine the Routing Tables.

The LANs connected to R1 and R3 should now be included in all three routing tables.

R2#`show ip route`

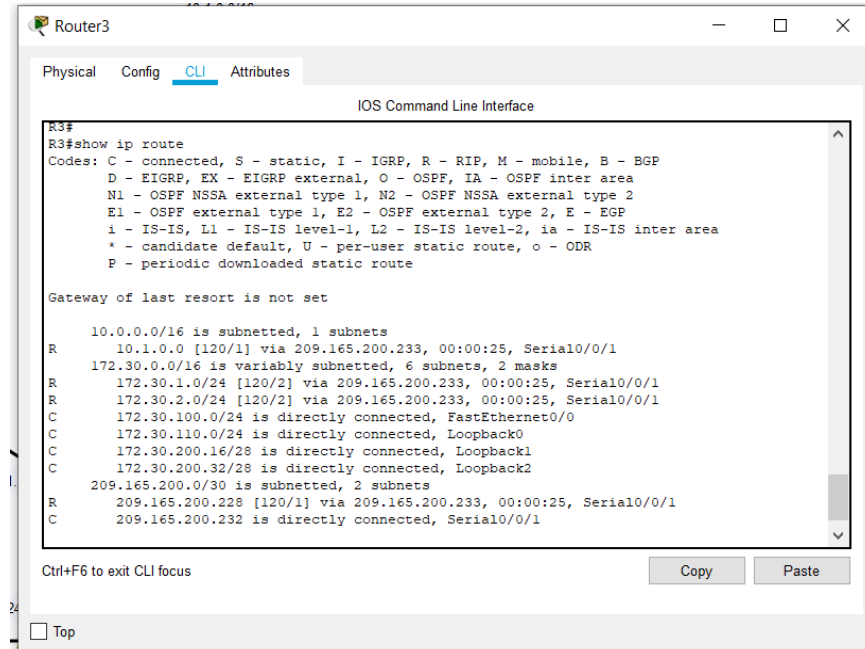

R1#show ip route

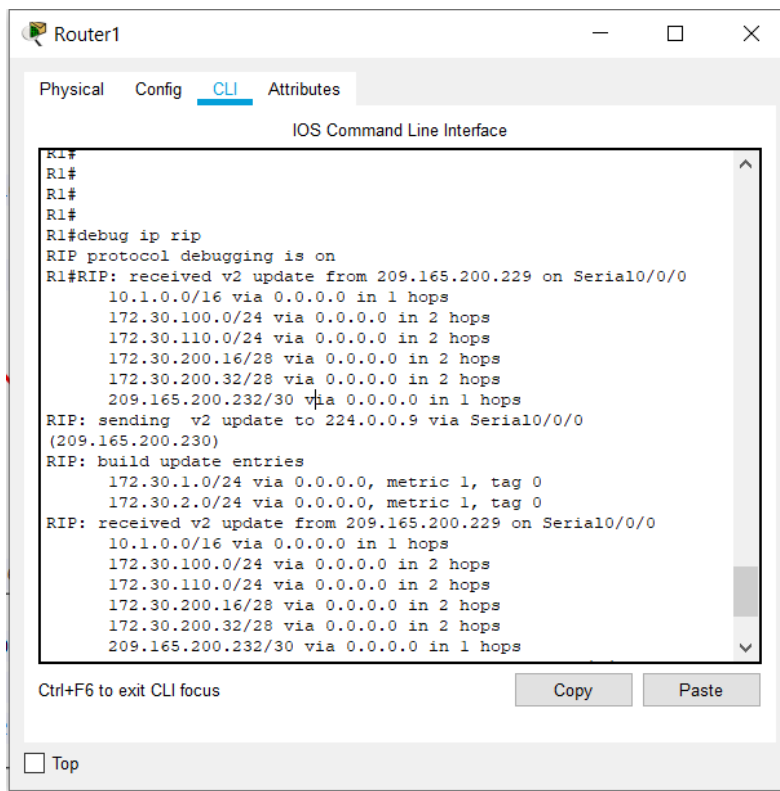

The screenshot shows the CLI of Router1. The command 'show ip route' has been executed, displaying the routing table. The output includes a legend for route codes (C, S, I, R, M, B, D, N1, N2, E1, E2, i, l, *, U, P), a message 'Gateway of last resort is not set', and a list of routes. The routes are: 10.0.0.0/16 (subnetted, 1 subnet), 10.1.0.0 [120/1] via 209.165.200.229, 00:00:26, Serial0/0/0, 172.30.0.0/16 (variably subnetted, 6 subnets, 2 masks), 172.30.1.0/24 (directly connected, FastEthernet0/0), 172.30.2.0/24 (directly connected, FastEthernet0/1), 172.30.100.0/24 [120/2] via 209.165.200.229, 00:00:26, Serial0/0/0, 172.30.110.0/24 [120/2] via 209.165.200.229, 00:00:26, Serial0/0/0, 172.30.200.16/28 [120/2] via 209.165.200.229, 00:00:26, Serial0/0/0, 172.30.200.32/28 [120/2] via 209.165.200.229, 00:00:26, Serial0/0/0, 209.165.200.0/30 (subnetted, 2 subnets), 209.165.200.228 (directly connected, Serial0/0/0), and 209.165.200.232 [120/1] via 209.165.200.229, 00:00:26, Serial0/0/0.

R3#show ip route

The screenshot shows the CLI of Router3. The command 'show ip route' has been executed, displaying the routing table. The output includes a legend for route codes (C, S, I, R, M, B, D, N1, N2, E1, E2, i, l, *, U, P), a message 'Gateway of last resort is not set', and a list of routes. The routes are: 10.0.0.0/16 (subnetted, 1 subnet), 10.1.0.0 [120/1] via 209.165.200.233, 00:00:25, Serial0/0/1, 172.30.0.0/16 (variably subnetted, 6 subnets, 2 masks), 172.30.1.0/24 [120/2] via 209.165.200.233, 00:00:25, Serial0/0/1, 172.30.2.0/24 [120/2] via 209.165.200.233, 00:00:25, Serial0/0/1, 172.30.100.0/24 (directly connected, FastEthernet0/0), 172.30.110.0/24 (directly connected, Loopback0), 172.30.200.16/28 (directly connected, Loopback1), 172.30.200.32/28 (directly connected, Loopback2), 209.165.200.0/30 (subnetted, 2 subnets), 209.165.200.228 [120/1] via 209.165.200.233, 00:00:25, Serial0/0/1, and 209.165.200.232 (directly connected, Serial0/0/1).

Use the output of the `debug ip rip` command to answer the following questions:

The screenshot shows a Cisco Packet Tracer console window for Router1. The window has tabs for Physical, Config, CLI (selected), and Attributes. The CLI tab displays the IOS Command Line Interface. The output shows the following sequence of events:

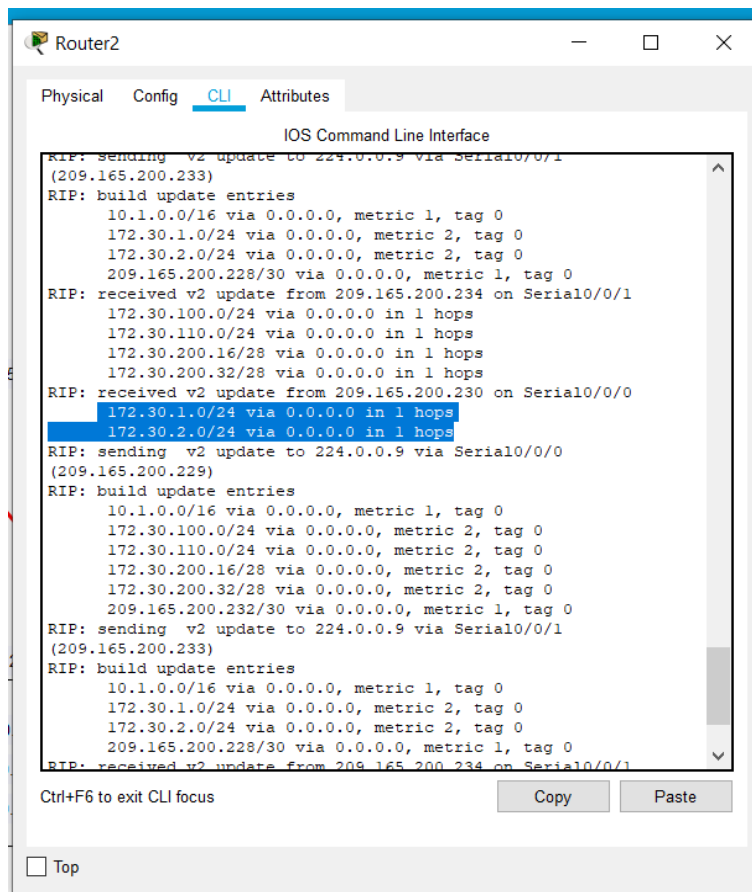

```
R1#
R1#
R1#
R1#debug ip rip
RIP protocol debugging is on
R1#RIP: received v2 update from 209.165.200.229 on Serial0/0/0
  10.1.0.0/16 via 0.0.0.0 in 1 hops
  172.30.100.0/24 via 0.0.0.0 in 2 hops
  172.30.110.0/24 via 0.0.0.0 in 2 hops
  172.30.200.16/28 via 0.0.0.0 in 2 hops
  172.30.200.32/28 via 0.0.0.0 in 2 hops
  209.165.200.232/30 via 0.0.0.0 in 1 hops
RIP: sending v2 update to 224.0.0.9 via Serial0/0/0
(209.165.200.230)
RIP: build update entries
  172.30.1.0/24 via 0.0.0.0, metric 1, tag 0
  172.30.2.0/24 via 0.0.0.0, metric 1, tag 0
RIP: received v2 update from 209.165.200.229 on Serial0/0/0
  10.1.0.0/16 via 0.0.0.0 in 1 hops
  172.30.100.0/24 via 0.0.0.0 in 2 hops
  172.30.110.0/24 via 0.0.0.0 in 2 hops
  172.30.200.16/28 via 0.0.0.0 in 2 hops
  172.30.200.32/28 via 0.0.0.0 in 2 hops
  209.165.200.232/30 via 0.0.0.0 in 1 hops
```

At the bottom of the console window, there is a status bar with the text "Ctrl+F6 to exit CLI focus" and two buttons: "Copy" and "Paste". Below the console window, there is a checkbox labeled "Top".

What entries are included in the RIP updates sent out from R1?

172.30.1.0/24

172.30.2.0/24

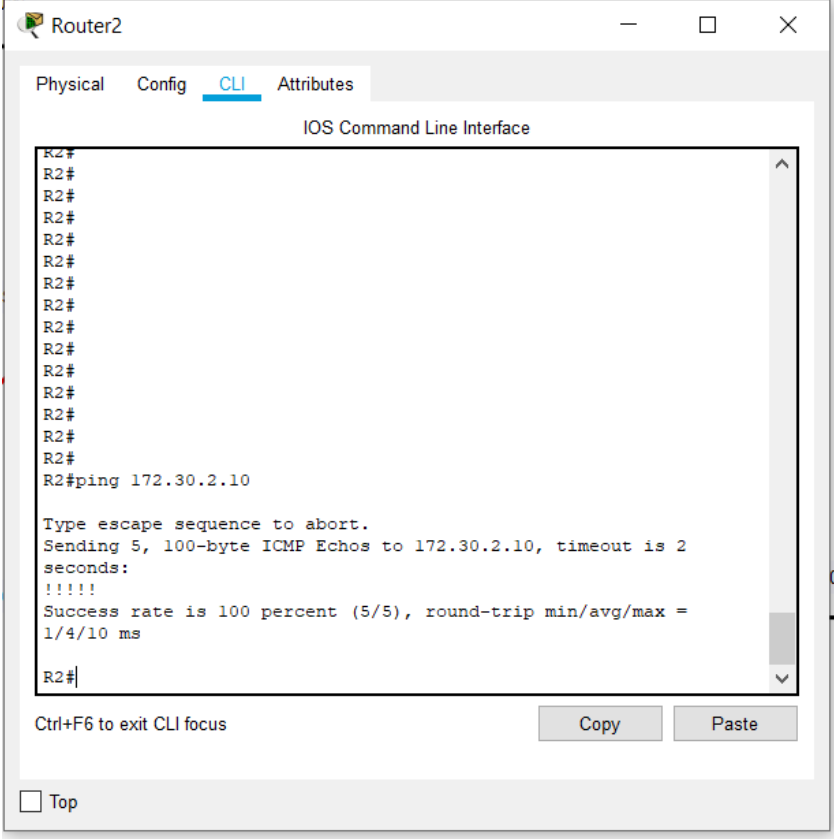

On R2, what routes are in the RIP updates that are received from R1?

172.30.1.0/24
172.30.2.0/24

Are the subnet masks now included in the routing updates? YES

Task 8: Verify Network Connectivity.

Step 1: Check connectivity between R2 router and PCs.

The screenshot shows a window titled "Router2" with tabs for "Physical", "Config", "CLI", and "Attributes". The "CLI" tab is active, displaying the "IOS Command Line Interface". The command history shows multiple "R2#" prompts, followed by the command "R2#ping 172.30.2.10". The output of the command is as follows:

```
R2#
R2#
R2#
R2#
R2#
R2#
R2#
R2#
R2#
R2#
R2#
R2#
R2#
R2#
R2#
R2#ping 172.30.2.10

Type escape sequence to abort.
Sending 5, 100-byte ICMP Echos to 172.30.2.10, timeout is 2
seconds:
!!!!
Success rate is 100 percent (5/5), round-trip min/avg/max =
1/4/10 ms
R2#
```

Below the CLI window, there is a "Ctrl+F6 to exit CLI focus" label, "Copy" and "Paste" buttons, and a "Top" button.

From R2, how many ICMP messages are successful when pinging PC1?

5 out of 5

The screenshot shows the Router2 CLI interface with the following text:

```
R2#
R2#
R2#
R2#
R2#
R2#ping 172.30.2.10

Type escape sequence to abort.
Sending 5, 100-byte ICMP Echos to 172.30.2.10, timeout is 2
seconds:
!!!!
Success rate is 100 percent (5/5), round-trip min/avg/max =
1/4/10 ms

R2#ping 172.30.100.10

Type escape sequence to abort.
Sending 5, 100-byte ICMP Echos to 172.30.100.10, timeout is 2
seconds:
!!!!
Success rate is 100 percent (5/5), round-trip min/avg/max =
1/8/13 ms

R2#
```

Buttons at the bottom: Ctrl+F6 to exit CLI focus, Copy, Paste, and a Top checkbox.

From R2, how many ICMP messages are successful when pingng PC4?

5 out of 5

Step 2: Check the connectivity between the PCs.

The screenshot shows the PC1 Command Prompt with the following text:

```
C:\>
C:\>
C:\>
C:\>
C:\>
C:\>
C:\>
C:\>
C:\>
C:\>
C:\>ping 172.30.1.10

Pinging 172.30.1.10 with 32 bytes of data:

Reply from 172.30.1.10: bytes=32 time=1ms TTL=127
Reply from 172.30.1.10: bytes=32 time<1ms TTL=127
Reply from 172.30.1.10: bytes=32 time=7ms TTL=127
Reply from 172.30.1.10: bytes=32 time<1ms TTL=127

Ping statistics for 172.30.1.10:
    Packets: Sent = 4, Received = 4, Lost = 0 (0% loss),
    Approximate round trip times in milli-seconds:
        Minimum = 0ms, Maximum = 7ms, Average = 2ms

C:\>
```

Buttons at the bottom: Top checkbox.

From PC1, is it possible to ping PC2? YES

What is the success rate? 100%

The screenshot shows a Windows PC window titled 'PC1' with tabs for Physical, Config, Desktop, Programming, and Attributes. The 'Desktop' tab is active, displaying a Command Prompt window. The Command Prompt shows the user entering 'ping 10.1.0.10' and receiving a successful response. The output indicates that 4 packets were sent and received with 0% loss. The approximate round trip times in milliseconds are: Minimum = 1ms, Maximum = 7ms, Average = 2ms.

- show ip route

R1 →

R2 ➔

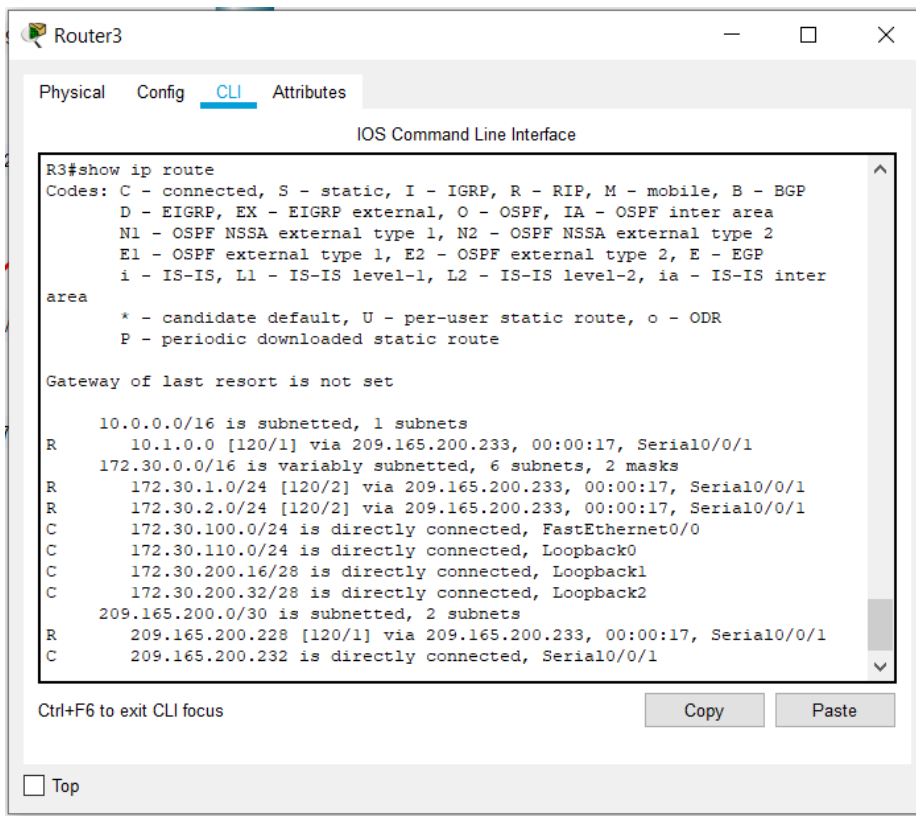

The screenshot shows the CLI window for Router2. The 'CLI' tab is selected. The command 'R2>ena' has been entered, followed by 'R2#show ip route'. The output displays the routing table, including codes for various protocols, a gateway of last resort, and a list of routes with their metrics and interfaces. The routes include 10.0.0.0/16, 172.30.0.0/16, 172.30.1.0/24, 172.30.2.0/24, 172.30.100.0/24, 172.30.110.0/24, 172.30.200.16/28, 172.30.200.32/28, 209.165.200.0/30, 209.165.200.228, and 209.165.200.232.

```
R2>ena
R2#show ip route
Codes: C - connected, S - static, I - IGRP, R - RIP, M - mobile, B - BGP
       D - EIGRP, EX - EIGRP external, O - OSPF, IA - OSPF inter area
       N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
       E1 - OSPF external type 1, E2 - OSPF external type 2, E - EGP
       i - IS-IS, L1 - IS-IS level-1, L2 - IS-IS level-2, ia - IS-IS inter area
       * - candidate default, U - per-user static route, o - ODR
       P - periodic downloaded static route

Gateway of last resort is not set

 10.0.0.0/16 is subnetted, 1 subnets
C    10.1.0.0 is directly connected, FastEthernet0/0
R    172.30.0.0/16 is variably subnetted, 6 subnets, 2 masks
R    172.30.1.0/24 [120/1] via 209.165.200.230, 00:00:03, Serial0/0/0
R    172.30.2.0/24 [120/1] via 209.165.200.230, 00:00:03, Serial0/0/0
R    172.30.100.0/24 [120/1] via 209.165.200.234, 00:00:27, Serial0/0/1

```

R3 ➔

The screenshot shows the CLI window for Router3. The 'CLI' tab is selected. The command 'R3#show ip route' has been entered. The output displays the routing table, including codes for various protocols, a gateway of last resort, and a list of routes with their metrics and interfaces. The routes include 10.0.0.0/16, 172.30.0.0/16, 172.30.1.0/24, 172.30.2.0/24, 172.30.100.0/24, 172.30.110.0/24, 172.30.200.16/28, 172.30.200.32/28, 209.165.200.0/30, 209.165.200.228, and 209.165.200.232.

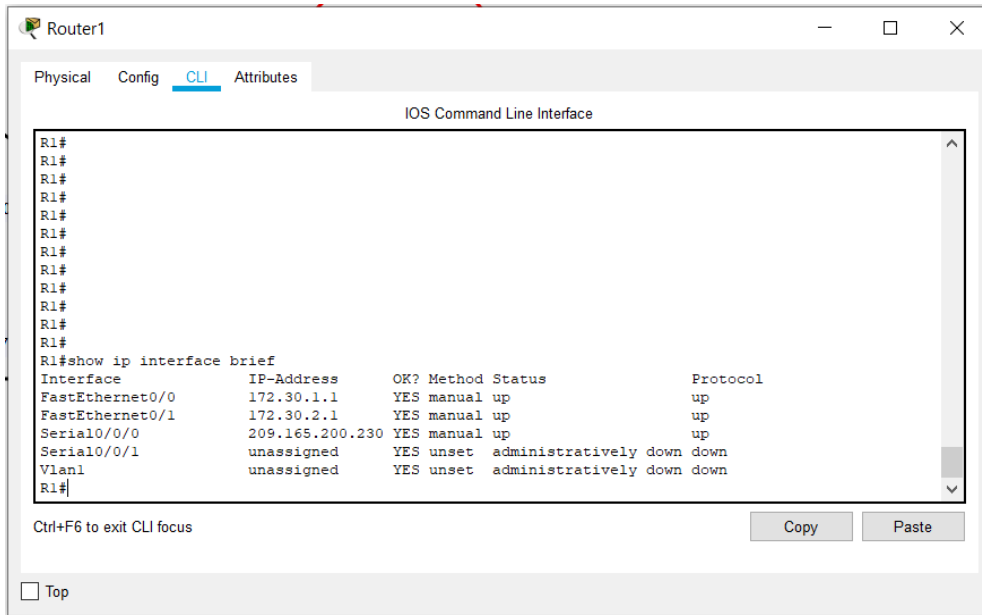

```
R3#show ip route
Codes: C - connected, S - static, I - IGRP, R - RIP, M - mobile, B - BGP
       D - EIGRP, EX - EIGRP external, O - OSPF, IA - OSPF inter area
       N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
       E1 - OSPF external type 1, E2 - OSPF external type 2, E - EGP
       i - IS-IS, L1 - IS-IS level-1, L2 - IS-IS level-2, ia - IS-IS inter
       area
       * - candidate default, U - per-user static route, o - ODR
       P - periodic downloaded static route

Gateway of last resort is not set

 10.0.0.0/16 is subnetted, 1 subnets
R    10.1.0.0 [120/1] via 209.165.200.233, 00:00:17, Serial0/0/1
 172.30.0.0/16 is variably subnetted, 6 subnets, 2 masks
R    172.30.1.0/24 [120/2] via 209.165.200.233, 00:00:17, Serial0/0/1
R    172.30.2.0/24 [120/2] via 209.165.200.233, 00:00:17, Serial0/0/1
C    172.30.100.0/24 is directly connected, FastEthernet0/0
C    172.30.110.0/24 is directly connected, Loopback0
C    172.30.200.16/28 is directly connected, Loopback1
C    172.30.200.32/28 is directly connected, Loopback2
209.165.200.0/30 is subnetted, 2 subnets
R    209.165.200.228 [120/1] via 209.165.200.233, 00:00:17, Serial0/0/1
C    209.165.200.232 is directly connected, Serial0/0/1

The screenshot shows the CLI of Router2. The command 'show ip protocols' has been executed, displaying the following information:

```
R2#show ip protocols
Routing Protocol is "rip"
Sending updates every 30 seconds, next due in 15 seconds
Invalid after 180 seconds, hold down 180, flushed after 240
Outgoing update filter list for all interfaces is not set
Incoming update filter list for all interfaces is not set
Redistributing: rip
Default version control: send version 2, receive 2
  Interface        Send Recv Triggered RIP Key-chain
  Serial0/0/0       2      2
  Serial0/0/1       2      2
Automatic network summarization is not in effect
Maximum path: 4
Routing for Networks:
  10.0.0.0
  209.165.200.0
Passive Interface(s):
  FastEthernet0/0
Routing Information Sources:
  Gateway         Distance    Last Update
  209.165.200.230  120         00:00:05
  209.165.200.234  120         00:00:28
Distance: (default is 120)
R2#
```

Below the output, there is a 'Ctrl+F6 to exit CLI focus' instruction and 'Copy' and 'Paste' buttons. A 'Top' button is also present at the bottom left.

R3 ➔

The screenshot shows the CLI of Router3. The command 'show ip protocols' has been executed, displaying the following information:

```
R3#show ip protocols
Routing Protocol is "rip"
Sending updates every 30 seconds, next due in 23 seconds
Invalid after 180 seconds, hold down 180, flushed after 240
Outgoing update filter list for all interfaces is not set
Incoming update filter list for all interfaces is not set
Redistributing: rip
Default version control: send version 2, receive 2
  Interface        Send Recv Triggered RIP Key-chain
  Loopback0         2      2
  Loopback1         2      2
  Loopback2         2      2
  Serial0/0/1       2      2
Automatic network summarization is not in effect
Maximum path: 4
Routing for Networks:
  172.30.0.0
  209.165.200.0
Passive Interface(s):
  FastEthernet0/0

R3#
```

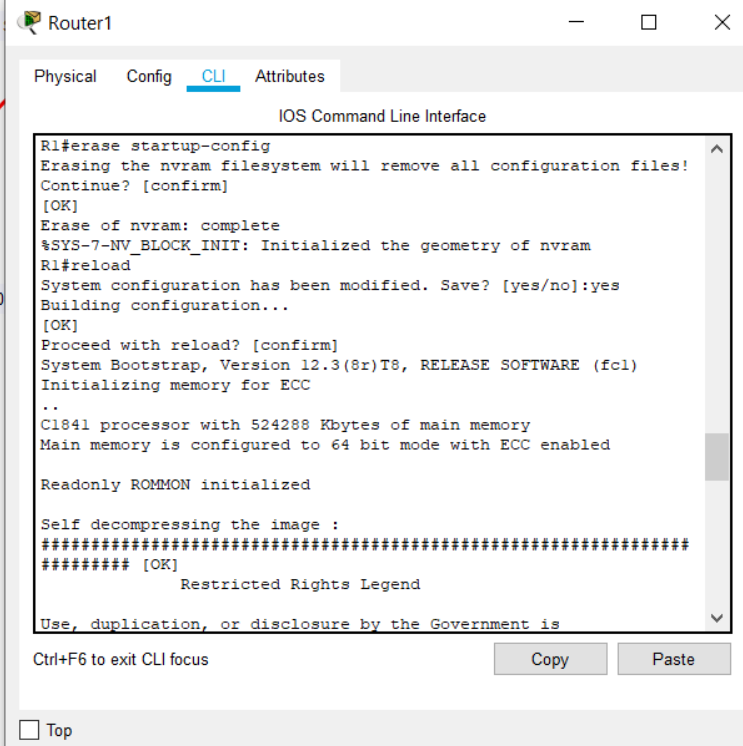

Below the output, there is a 'Ctrl+F6 to exit CLI focus' instruction and 'Copy' and 'Paste' buttons. A 'Top' button is also present at the bottom left.

If you need to review the procedures for capturing command output, refer to Lab 1.5.1.

Task 10: Clean Up

Erase the configurations and reload the routers. Disconnect and store the cabling. For PC hosts that are normally connected to other networks (such as the school LAN or to the Internet), reconnect the appropriate cabling and restore the TCP/IP settings.
